Komatsu Mining Corp. Group

Who we are:
Since 1921, Komatsu has stood for unrivaled quality and reliability. Our enduring global success stems from the principles of our founder, Meitaro Takeuchi, who envisioned a sustainable future built through globalization, quality first, technology innovation and talent development. These defining principles, along with an emphasis on safety and compliance, remain part of our Komatsu DNA. With each brand and company added to the Komatsu family, we expand our capabilities, leveraging our global teams to push beyond what can be done and create what can be imagined. We believe partnering directly with our stakeholders and being in the workplace (gemba) is the best way to gain insight into their challenges, win their trust and develop cutting-edge solutions.

What we do:
Komatsu is an indispensable partner to the mining, forestry, industrial and construction industries that maximizes value for customers through innovative solutions. With a full line of products supported by our advanced IoT technologies and global service network, we help customers safely and sustainably optimize their operations.

Complete longwall systems
Komatsu offers a complete range of longwall equipment to suit the needs of mining operations worldwide. Globally recognized as the leading manufacturer of complete longwall systems, Komatsu provides its customers with a single, accountable source for shearers, roof supports, face conveyors, stageloaders, crushers and mobile belt tail pieces.

All of the elements of modern, high production longwall systems are provided in an integrated manner for maximum productivity gains and lowest cost per ton. In addition to developing the most technologically advanced products, Komatsu provides professional project management capability to deliver an integrated system on-time, to specification and on-budget.

When only the best will do . . .
Complete longwall systems from Komatsu represent the ultimate solution for high production longwall mining. Komatsu incorporates the best-of-breed shearers, roof supports, face conveyors, stageloaders, crushers and mobile belt tail pieces to deliver a complete longwall system that is in a class of its own. Output productivity of this integrated system simply cannot be matched by integration of stand-alone components. When a mining operation calls for the most productive, most reliable longwall system, there is only one place to find it.

• Individual product design improvements are made with system implications already considered, balanced and optimized
• Complete electronic systems maximize communication, diagnostics and monitoring signals
• Personalized and dedicated engineering and service representatives produce unrivaled system optimization

Industrial minerals
Mechanizing extraction...

Globally recognized as the leading manufacturer of complete longwall systems.

Longwall Shearer
The most technologically advanced and productive shearers in the industry.

Armored Face Conveyor
Available for all seams with capacities up to 6,000 tons (5,400 tonnes) per hour.

Powered Roof Support
Custom designed to meet exacting cycle and operating requirements.

AFC Optidrive System
An intelligent variable speed and torque drive solution for your AFC and BSL.

Stageoader
Moves continuously and provides necessary overlap to suit mining conditions.

Crusher
Extremely rugged and trouble-free with little maintenance required.
Longwall Systems

Komatsu Mining Corp. Group

Faceboss RS20s

The Faceboss RS20s system requires no special gate-end computer for control and is the fastest and most powerful shield control system ever supplied by Komatsu. These systems are globally fitted on the most automated and productive longwalls.

Surface data communication link

With the Surface Data Communication Link, real-time operational information is transmitted via an ethernet connection to the surface. This information is identical to the information available underground. The Surface Data Communication Link includes a data storage feature that allows recorded data to be played back for in-depth analysis without affecting production.

Many mines are now using mine-wide Supervisory Control And Data Acquisition (SCADA) systems to monitor the production process. The Joy Outby System provides an Object Linking for Process Control (OPC) interface that enables information from Komatsu equipment to be easily transferred to the mine’s SCADA system. All major manufacturers of SCADA systems support OPC.

Remote monitoring

This optional feature provides real-time video using cameras that are integrated into the design of the ranging arms and chassis. Video signals are displayed at the Remote Management Centre on independent monitors. With automated water sprays to keep the camera lenses clean, this feature enables the possibility of operating the machine from a remote location with a familiar handheld device.

Advanced shearer automation

Further increasing productivity and reducing operator exposure to dust and noise, this newest level of shearer steering technology allows for the programming of fully-automated cutting sequences, including gate end turnarounds. The latest feature included with advanced shearer automation is the ability for the user to create an initial cutting profile and extraction heights by use of a graphical offline planner. With this plan, the machine automatically replicates the profile until conditions change. The operator then has the ability to override control of the roof drum to follow the preferred horizon. Utilizing this new roof horizon data, the remainder of the cutting sequence is fully automated per the pre-defined extraction heights. This advanced level of automation enables the most efficient cycle times possible while providing consistency from one day to the next.

Remote operation

The HHX remote uses reliable two-way radio communication to control the shearer and display operational and diagnostic information on an integrated LCD screen. As an integral part of the Faceboss platform the remote fully supports Advanced Shearer Automation. The large capacity, removable battery pack allows long intervals between recharging on the dedicated charging station. With an ergonomic design and minimal complexity, the HHX remote offers comfortable operation and high reliability.

User friendly interface

Simplified setup...

Standard on the Faceboss platform, a graphical onboard interface with intuitive screens provides simplified commissioning tools, user configurable options and real-time diagnostics.

Longwall automation

The Faceboss control platform enables operators to consistently operate at the optimal balance of production rate and cost. Faceboss is the standard control platform across all Komatsu underground product lines. In longwall mining applications, this platform enables users to utilize proven machine control as well as the latest advancements in automation for maximum productivity. The control software is designed to minimize an operator’s exposure to dust, water spray and noise by keeping personnel on the upwind side of the machine.

The latest development within Faceboss is the integration and data exchange between the shearer and roof support systems which provides a more automated longwall. This integration and data exchange results in the most consistent and efficient cycle times while minimizing the need for human intervention and improving overall safety on the longwall face.

Advanced shearer automation

Further increasing productivity and reducing operator exposure to dust and noise, this newest level of shearer steering technology allows for the programming of fully-automated cutting sequences, including gate end turnarounds. The latest feature included with advanced shearer automation is the ability for the user to create an initial cutting profile and extraction heights by use of a graphical offline planner. With this plan, the machine automatically replicates the profile until conditions change. The operator then has the ability to override control of the roof drum to follow the preferred horizon. Utilizing this new roof horizon data, the remainder of the cutting sequence is fully automated per the pre-defined extraction heights. This advanced level of automation enables the most efficient cycle times possible while providing consistency from one day to the next.

User friendly interface

Simplified setup...

Standard on the Faceboss platform, a graphical onboard interface with intuitive screens provides simplified commissioning tools, user configurable options and real-time diagnostics.
The Joy shearer, introduced in 1976, was the first multi-motor shearer and this design concept became the global standard for all longwall shearers. Komatsu expanded its worldwide market presence by providing safer, productive, reliable machines that produce at the lowest cost per ton. Joy shearers are supported with first class service and through Life Cycle Management agreements, replacement refurbished machines, built to OEM specifications, are available for exchange at panel moves. In addition, Komatsu provides the highest level of face automation that allows customers to benefit from safer, consistent, repeatable operation.

Longwall shearers

Komatsu built the first all-electric shearing machine in 1976. Today, Joy Shearers are utilized around the world by the most productive mines, in the most demanding environments. A wide range of shearer models is offered to accommodate seam ranges from one and a half to seven meters. The advantages of the modular design, Optidrive variable frequency drive and new Advanced Shearer Automation system provide high productivity with lower costs and a focus on a zero harm mentality.

Modular design advantages

Komatsu’s modular design consists of five main structural elements. The body of the shearer consists of three high tensile steel fabrications bolted together to form a slim main section with no under-frame. This design provides maximum under-body clearance for material passage in a given seam thickness. The elimination of the under-frame also makes underground transportation easier.

The controller case, which forms the center section, contains the electric control system. The Komatsu design features gob-side access to the electrical controller section and motors which means that normal maintenance can be carried out in a safer working environment.

Two traction sections are bolted and doweled to each end of the controller case. The down-drives are bolted to the traction cases in an arrangement that permits the custom fitting of the shearer within the AFC and roof support envelope. A wide selection of Komatsu designed and manufactured down-drives can be fitted to the shearer to suit mining conditions and AFC selection.

High tensile steel ranging arm castings house the cutter motors and cutter gearcases. Ranging arm cylinders are made using technology from the Joy Powered Roof Support product line. These cylinders have double the pressure rating when compared to the industry norms. In-house manufacture of bit holders and cutter drums creates a higher degree of integration and allows engineers to better understand the drum’s affect on machine performance. Gearing is designed and manufactured in our own factories using proprietary processes which contributes to maximum performance.

Optidrive transmission

The Optidrive transmission from Komatsu is a power-matched, integrated drive transmission that includes gear-box, AC electric motor, Variable Frequency Drive (VFD) and control technology. The holistic design approach provides an optimal, rugged and reliable solution for shearer traction systems.

Drums

Custom designed...

At Komatsu, drums are custom designed to meet your unique conditions. Joy drums are manufactured using our own patented design three-axis digital lacing machines to achieve precise bit locations and angles. The bit positions for each thread are digitally recorded for traceability. Final machining of drum bore is accomplished with state-of-the-art CNC turning centers to achieve a precise fit for your Joy longwall shearer.

Rugged, reliable and easy to maintain

The modular construction of Joy longwall shearers allows for efficient manufacture and rebuild. The Joy shearer is designed to be as simple and easy to maintain as possible with special tools rarely required. Komatsu also integrates the cowl turning mechanisms into the ranging arm designs creating rugged components.

Longwall Systems

Roof supports

Komatsu has over 60 years of experience designing and manufacturing longwall roof supports and has achieved ISO 9001 2008 certification. Our development and test facility has UKAS Accreditation. With installations around the world, Komatsu has met or exceeded the customer’s rigorous requirements with ratings up to 1750 tonne (2000 tons); in widths of 1.5, 1.75 and 2.05 meters; for height ranges from 0.8 up to 7.8 meters.

Structural design is a particular strength of Joy roof supports. The design and the attention to detail of the structures has been recognized throughout the mining industry. These detailed and controlled fabrications enable Joy roof supports to provide reliable service with a lower cost of ownership and fewer rebuilds required during their service life.

Leg construction

Joy roof support legs are designed and tested to achieve extended life. Our bespoke internal seals work with the cylinders to provide a long service life between rebuilds with leg bore sizes ranging from 125mm to 480mm plus. Single, double and triple telescopic designs can be provided depending on support range requirements. Along with the FEA and fatigue analysis software, Komatsu also uses the very latest CAD technology to enable the design of galleries and feed pipes to maximize flow and minimize pressure drops and turbulence. This is an important feature in optimizing hydraulic efficiency and keeping support cycle times to a minimum.

For large bore diameter legs that require high flow and hence large feed pipes combined with high fatigue life requirements, Komatsu has developed a new leg design that allows large capacity feeds to be used by the legs. To achieve high fatigue life, no welds are used on the leg cylinder and the feed is attached by a patented locking system. This allows large capacity feeds to be used by the legs. To achieve high fatigue life, no welds are used on the leg cylinder and the feed is attached by a patented locking system.

Hydraulic system design

Cycle time is an important feature of roof supports ensuring that on high production longwalls, the roof control does not slow the shearer cutting rate. Komatsu uses the latest technology available to calculate pressure drops, optimize fluid velocity, calculate flow rates and optimize hose sizes to give the best solution whilst complying with international standards.

Roof support electronics

Joy roof supports are controlled using the Faceboss RS20s electronic control system which integrates into the longwall and mine-wide system to enable automatic control of the longwall operation, including fully automatic shearer and roof support gate turn rounds. All the information from the longwall system can be transmitted to the surface and viewed throughout the mine network and with the mine’s agreement relayed in real-time back to Komatsu enabling utilization of our “Smart Services.”

Compak valve system

Compak, Joy’s hydraulic control system, is a well established, proven and reliable valve system for controlling modern automatically operated longwall roof supports. The system provides multifunctional control with solenoid-actuated pilot circuits receiving instructions either by operator push button or more normally, automatically from the Faceboss RS20s electronic control system. Manual spools provide operators with a proportional control capability.

Faceboss Compak

Joy’s latest distributed valve system, utilises serial solenoids and allows valve gear to be sited next to the function it controls, this reduces hoses by up to 32%, improves on the ergonomics and assists with flows and pressures.

Quality assurance

All Joy structural fabrications undergo detailed finite element analysis with experienced in-house engineers. Structures undergo overload of up to 120% (200% for leg pockets) and are fatigue-tested at up to 112% of their rated load to verify the intended life. The structural testing is conducted at the Komatsu testing laboratory, which houses one of the world’s largest rated purpose designed test rigs. The roof supports are also subjected to lateral fatigue testing in combined tests. Komatsu designs and delivers roof supports that are tailored to the mine’s life requirements from 15,000 to 90,000 plus cycles.

Komatsu Mining Corp. Group
Armored face conveyors

Komatsu manufactures all the key elements for the armored face conveyor (AFC) including the head and tail frames, line pans, gear boxes, sprockets, couplings and shearer haulage systems.

Cast design provides tighter tolerance assurance.

The design of the Joy AFC uses cast steel sigma sections with exacting tolerances. This casting technology eliminates the weld fabrication of clevis and pan connections, which are less reliable. The cast design provides tighter tolerance assurance which is essential in today’s marketplace. Komatsu’s high specification abrasion-resistant upper deck plates, selected to meet pan life requirements, result in maintenance free, long life fabrications.

AFC linepans

Joy AFC linepans have become the linepan of choice for heavy duty applications. The simple but rugged linepan construction is superior in fatigue resistance compared to other construction techniques, and includes the option of standard or machined pan joints. Linepans are fully tested for articulation and horizon control characteristics. Customizable cast side sections allow material to be placed where needed to match customer-required service life. Highly abrasion-resistant materials are used in construction to achieve wear longevity.

AFC transmissions

All Joy AFC transmissions are continuously rated at the maximum stated capacity. Transmissions can be used in conjunction with a variety of coupling solutions. A full monitoring package is available on all transmissions. Sizes are available for all AFC capacities including 11kV electric motors up to 1800kW. These advanced transmissions are specifically designed for low cost overhauls.

Broadband long life chain

Available in five sizes from 38mm up to 60mm diameter, Joy Broadband long life chain provides proven extended wear resistance without detriment to chain weight and conveying characteristics. This chain delivers new levels of conveying efficiency and reduced operating cost.

First installed in 2004, over the last eight years the chain has conveyed over 80 million tonnes on AFC and BSL applications in high productivity longwall installations operating in many major markets. Joy Broadband long life chain provides the greatest opportunities to longwall operators planning their future developments or upgrade requirements.

AFC couplings

Since 1994 the Turbo Transmission Technology (TTT) coupling has been supplied on Joy AFC equipment and is still in service today. TTT coupling is capable of high frequency heavy load starts without overheating or equipment damage. These ultra-reliable units have no bearings or seals, require very little maintenance and minimize the cost of overhauls. These units are extremely fault-tolerant and exhibit no loss of torque under normal voltage drop situations. Couplings come with onboard water filtration and the latest control valve has separate pilot filtration to help prevent problems caused by water quality. The latest version of the Joy couplings can be de-mounted in one convenient unit.

Turbo Transmission Technology

Komatsu has supplied Turbo Transmission Technology (TTT) couplings in various forms since 1994 and these couplings have become the coupling of choice for all the major mining companies on a worldwide basis due to the simplicity, ease of operation, high performance and reliability of the units. The TTTF is the latest variant of this high performance coupling and like its predecessors is only available from Komatsu.

The latest features of the TTTF include the ability to dismount the unit in one piece from the gear train, a robust filtration system and uprated valve design to cope with fluctuations in water quality.

The TTTF range of couplings is made up of the 562 and 650 size units. This range allows for up to 30,000 Nm of torque transmission and provides future upgrade opportunities for wider and higher production capability.

Optidrive

The Medium Voltage (MV, 3300 or 4160 V) integrates the Variable Speed Drive (VSD) with the motor to achieve better speed and torque control – resulting in a softer start and stop and faster acceleration. The variable chain speeds that match production conditions allow for increased capacity, improved cutting cycles, and the ultimate efficiency for your longwall system.
Smart Solutions

Integrated Smart Solutions help solve customers’ toughest challenges using data-driven intelligence, collaboration through partnership and experience-based service execution. They are a way of partnering with customers to help reduce costs and increase productivity, in line with customers’ operating and financial goals.

Komatsu service facilities have given world-class service a new home.

Outby equipment

Stageloaders
Joy Stageloaders are manufactured using a fully customized approach that incorporates proven design technologies. An extensive range of features is available to suit the longwall environment and the customer’s needs. Machined joints are fully sealed for dust and noise limitation. Ultra-reliable crusher designs are available including pick shaft and high inertia impact style units.

Crushers
Komatsu manufactures a complete range of stageloader crushers designed to be extremely rugged and trouble-free with little maintenance required. Built for difficult conditions, these crushers can efficiently handle lump coal and oversize rock which eases conveying and improves system productivity. To suit customer preference, Joy Crushers are available in a direct gear-drive or a V-belt drive.

All Joy Crushers incorporate a frame fabricated from heavy steel plate and strengthened by heavy ribs for maximum rigidity. Easy access to the crusher roll is provided through an inspection door in the top of the frame. Models are available that allow the top of the frame to be completely removed in order to lower the transportation height. Product size adjustment is accomplished by vertical movement of the roll shaft assembly, which is carried out by means of hydraulic cylinders that facilitate rapid adjustments.

Mobile belt tail pieces
The complete range of Joy mobile belt tailpieces enables longwall retreats to take place without stopping the belt or interrupting the flow of coal from the longwall face. Various models are offered for low, medium or high seam applications in either a “Matilda” style, or a self-propelled crawler and skid-mounted unit.

The two basic types of self-propelled units are those driven directly from the shield support hydraulic system, and those that have an “on-board” hydraulic pump. The crawler-mounted units are complete with heavy-duty replaceable pads and are internal planetary gear driven. Roof jacks and belt wipers are standard equipment and leveling jacks are located on each corner.

Smart Solutions at work:

Costs
• Lower cost per unit produced by reducing overall parts and consumables expenditures
• Optimize costs for power/fuel, labor and rebuilds

Safety
• Automate processes and controls
• Increase awareness through training and standard setting

Productivity
• Improve system availability, performance, utilization and consistency
• Leverage extensive Komatsu engineering knowledge to solve problems

Komatsu has invested in bulk materials simulation software for use in designs of the AFC product line. This software provides the simulation and analysis required to enhance innovation and helps design engineers to optimize the performance of bulk materials handling including:
- Optimizing conveyor transfer points
- Improving the performance of linepan control
- Increasing efficiency of crusher design
- Improving design of discharge hoods and hoppers to control throughput

Bulk material simulation
Optimize, improve and increase...

Smart Solutions

Smart Solutions are integrations of smart connected Komatsu products and systems, advanced analytics and direct services customized to solve customers’ toughest challenges.

Our commitment to world-class service is delivered through world-class processes and metrics. Our Joy Optix processes bring operational excellence by prioritizing the elimination of waste, simplifying processes, automating and removing people from harm’s way. We leverage these principles throughout our network, with the ability to rapidly customize locally, helping customers work smarter, worldwide.

Komatsu service facilities have given world-class service a new home.
